

2.8

Transforming API Response

RECAP

1. Inside advice package create class GlobalResponseHandler with @RCA that implements RBA<Object>
2. Override support() and beforeBodyWrite()
3. Create a class ApiResponse<T> with 3 fields timestamp , T data , ApiError error with optional field constructor
4. Also add @Data and @Builder over ApiResponse
5. Inside body() using if-else return the body in both the scenario using ApiResponse
6. Inside supports() return true so that it can catch the normal response from controller also
6. Change the return type of EH to RE<ApiResponse>
7. Change the data and time format using @JsonFormat(pattern)

Transforming API Response

- Extend your class with `@ResponseBodyAdvice<Object>` to define the custom return type.
- Use `@RestControllerAdvice` for global API Response transformation.
- Return appropriate HTTP status codes and error messages.
- You can also return the timestamp of the API response.
